Agenda

1. Temperature Monitoring At-a-Glance
2. Real-World Use Cases
3. Depot-to-Site Logistics
4. Site Support
5. Why Integration Matters

Monitoring for Clinical Supply Chains

Importance of Temperature Monitoring:

Temperature excursions can degrade product integrity, impact patient safety, and create compliance risks.

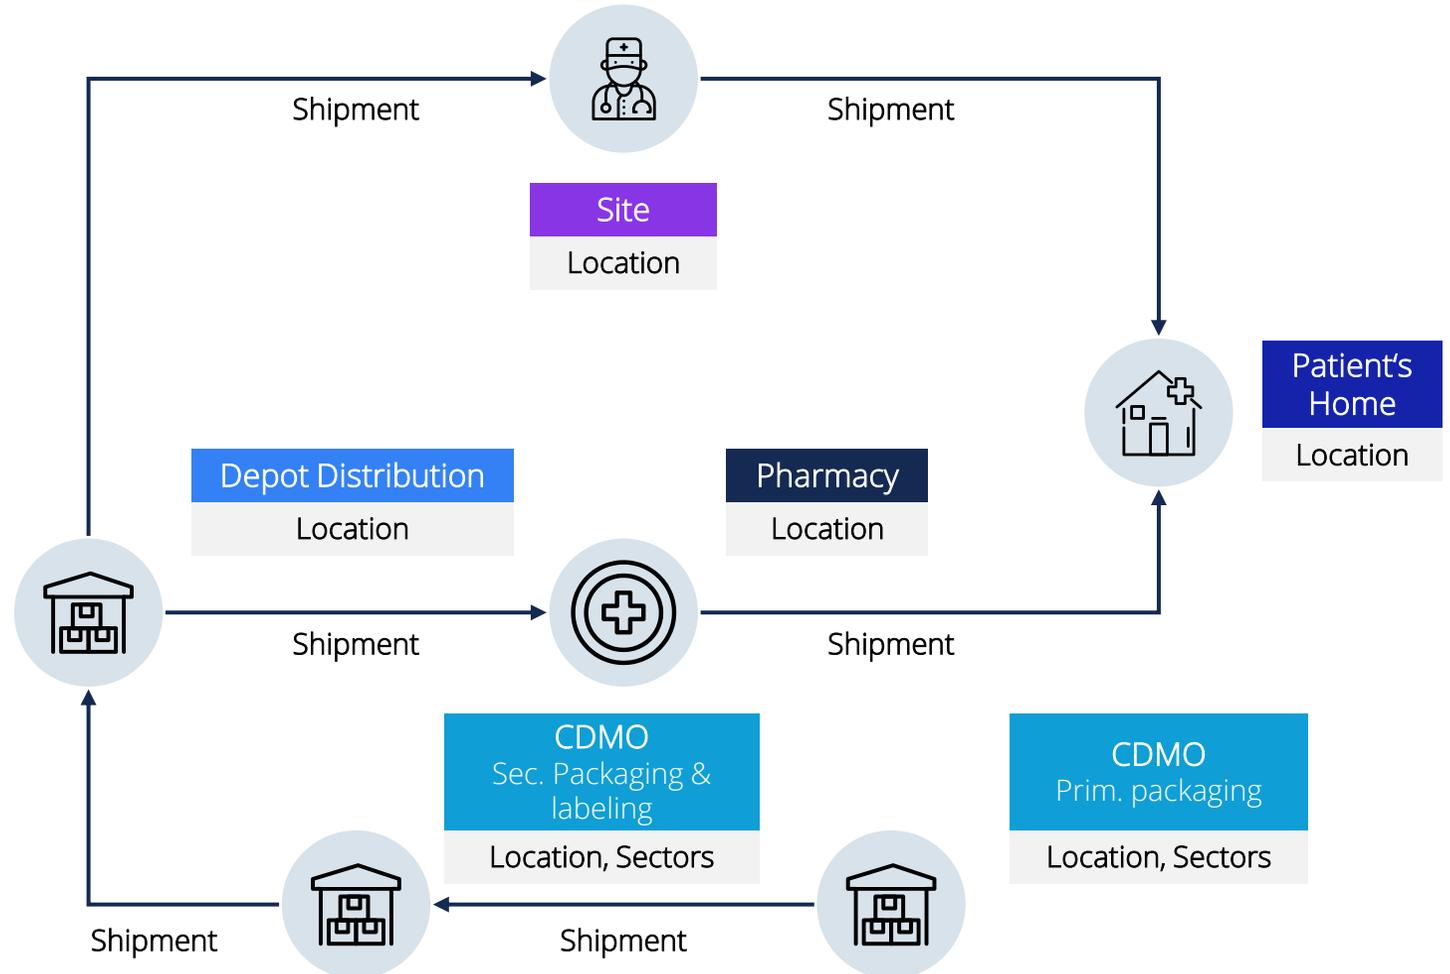

Minor deviations cause costly delays and wasted inventory.

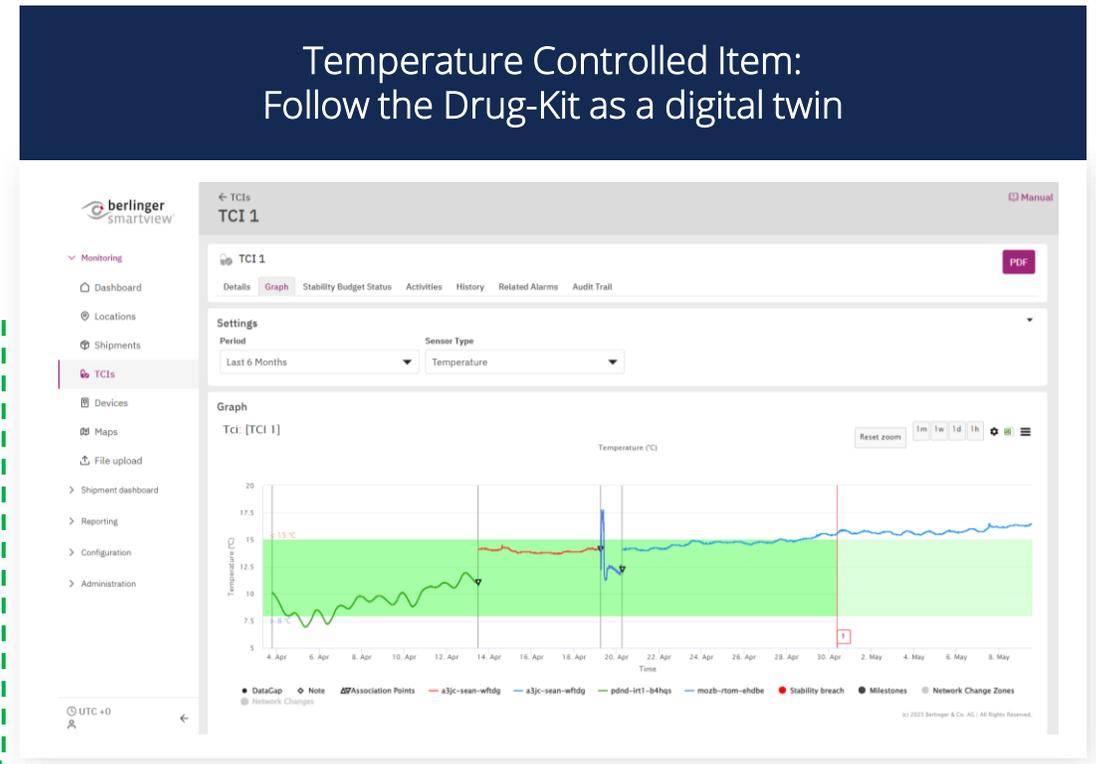

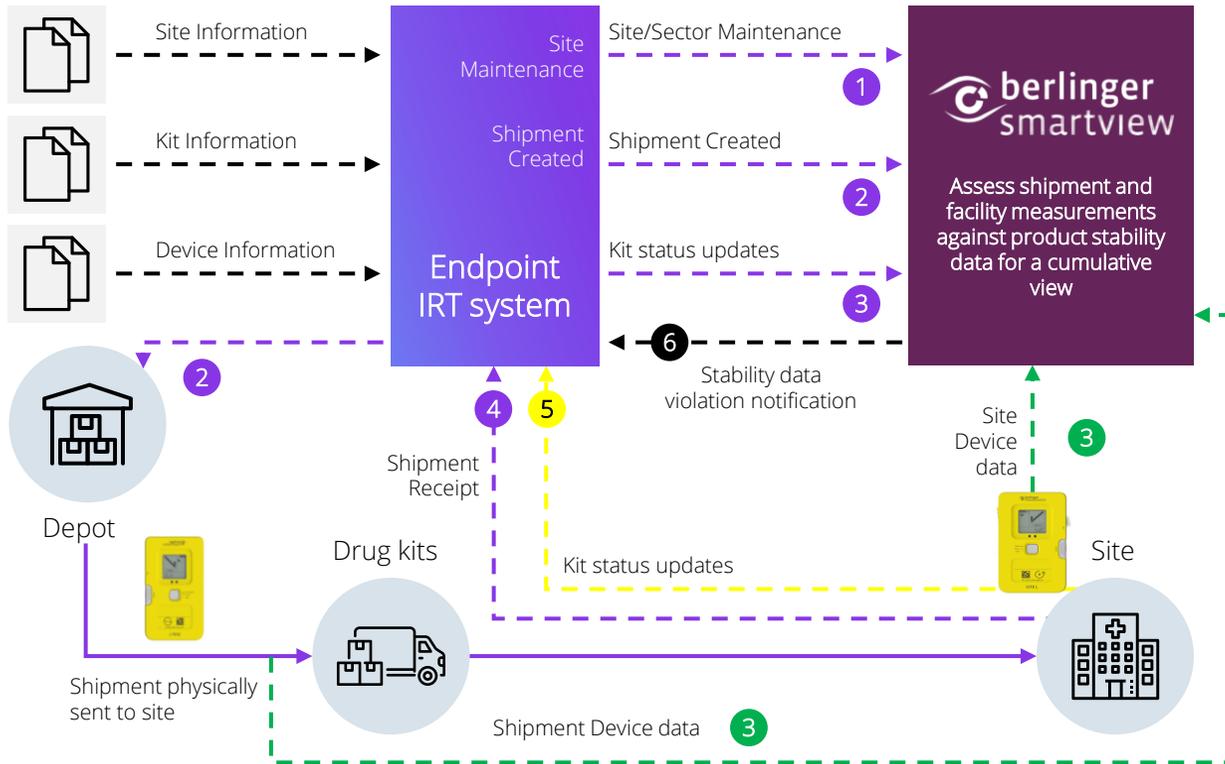

Real-time monitoring solutions like SmartView detect excursions in real-time, triggering immediate action.

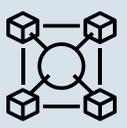

Endpoint Clinical's RTSM system automates tracking and ensures sites are always stocked with viable products.

End-to-End Monitoring: One Platform, Full Control

 RTSM enables proactive decision-making by integrating shipment and site data.

 By aligning temperature tracking with inventory management, clinical teams gain full control over supply chain logistics.

 This integration leads to faster response times and better regulatory compliance.

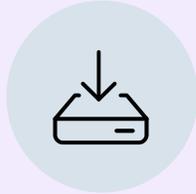

Seamless Integration, Real Results

Significant time and workload savings for CDMOs, CROs, Sites and Sponsor

Avoidance of expedited Shipments, Patient Rescheduling,

Much improved audit preparation; all data in one place

Automation has reduced human errors for all stakeholders

Greatly reduce manual processes, few or no manual assessments

Improved Patient Safety results from automation and single source of truth

Much reduced risk of dispensing drug that is no fit for use

Reduced material wastage of IMP/ drug kits

Lanes with a high percentage of Excursions can be evaluated and issue resolved: that way future waste can be avoided

Ongoing Innovation

Further improving visibility

RTSM Connectivity

Utilization of next generation temperature loggers capable of:

- Providing auto-resolution of TEs capability through an integration with RTSM
- Stability budget management through RTSM integration
- Hub and Spoke Models

Loggers

Sensor options:

- Temperature
- Humidity
- Light
- Tilt
- Shock
- Free-fall

Data

transmission:

- NB-IoT
- Wi-Fi
- BLE
- Cell LTE Cat M1 (4G/5G)
- 2G

Cloud- Based

Remotely configurable tracking technology provides insights to:

- Shipping conditions
- Handling
- Risk excursion (prediction)
- General status beyond the oversight of drug supply stakeholders

GPS Real-time

Use of monitoring devices capable of real-time communication of:

- Location status in real-time
- Notifications and alerts

▶ Real-World Use Cases for RTSM-Integrated Temperature Monitoring

Use Case 1: IMP with short shelf-life & -80°C requirement

Challenges Beyond Temperature Management Alone

Real-time:

know where the IMPs are and in what condition in real-time

Temperature:

Non-radionuclide part of the IMP is highly temperature sensitive

Location:

The radionuclide has a short half-life. Disruption or delay in the transport process will jeopardize the integrity of the IMP

Light

the inclusion of a light sensor serves as an additional safeguard.

Tilt:

Some solutions for shipping materials at approximately -80°C require them to be maintained in an upright position

Real-Time Monitoring with SmartSystem

GPS

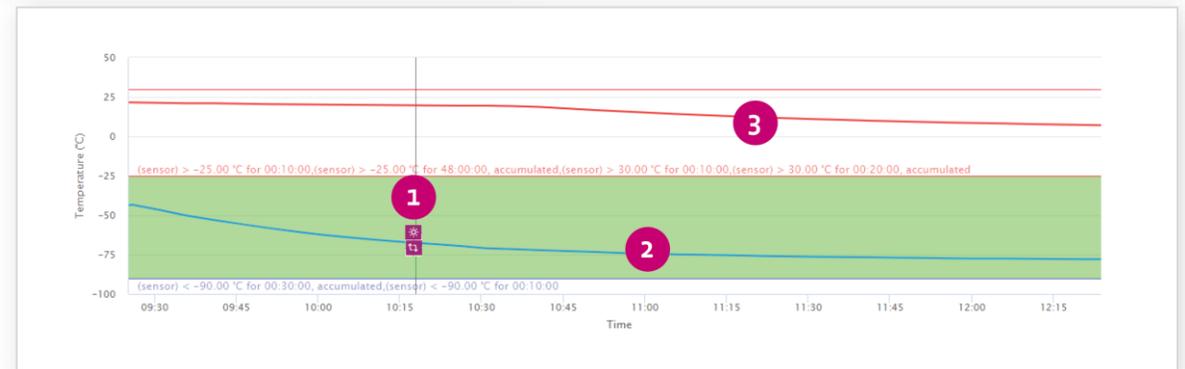

location of events during shipment from Production to clinical site

Temperature:
both inside and outside
packaging (2) and (3)

Tilt and light:
opening of package (1)

Use Case 2: Shipment Monitoring

Direct Administrative Savings of an End-to-End IRT/SmartView Integrated System

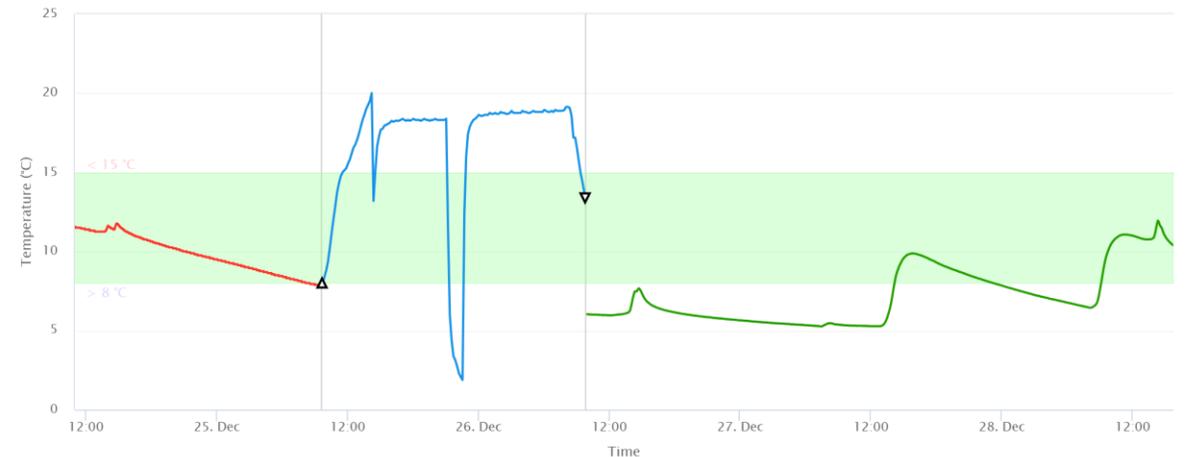

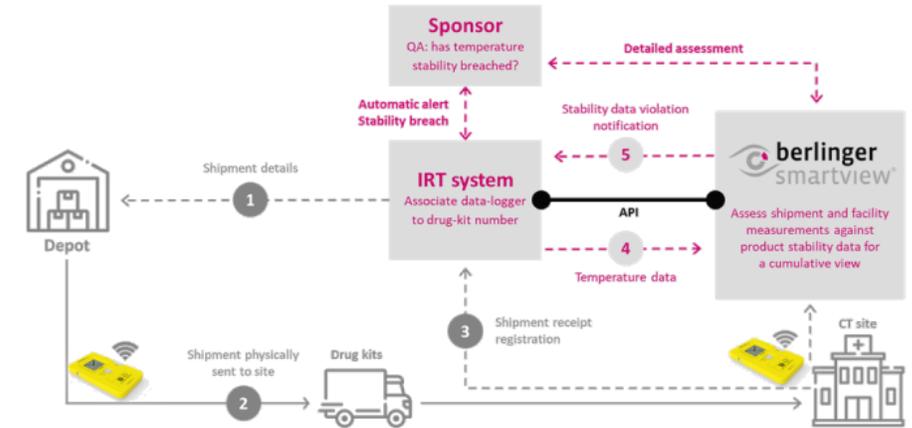

The Case:

- A sponsor working with a CRO and a CDMO
- The study: Ph II; IMP: monoclonal antibody
- Over 1800 depot-to-site shipments
- 4 depots; 89 sites; 90 unique legs
- Period: 2 years
- 110 temperature excursions over 79 shipments
- TE duration: 2 – 8386 mins (median = 17 mins)
- 21 shipments experienced a stability budget breach

Administrative savings of an integrated solution on shipments :

- Before: Manual/Paper Based/Email
- After: Integrated Solution

Use Case 2: Shipment Monitoring

Direct Administrative Savings of an End-to-End IRT/SmartView Integrated System

TE Process Before

For each Temp Excursion:

- Manual filling out form/info by site
- CMO review if appropriate
- Responsible person review
- Consultation of many sources for temp info and prior TEs
- Site putting IMP kits in quarantine
- QA / CDMO forwarding info to site
- Info entered into IRT
- Site marks IMP kits for destruction or made available again

110 TEs needed to be assessed

21 stability budget breaches to be assessed

Total time spent/cost: 702 h, ~120'500 €

TE Process After Integrated System

TE without budget breach: "auto-resolved": no time needed

21 stability budget breaches to be assessed

Total time spent/ cost: 21 h, 6'400 €

smartview

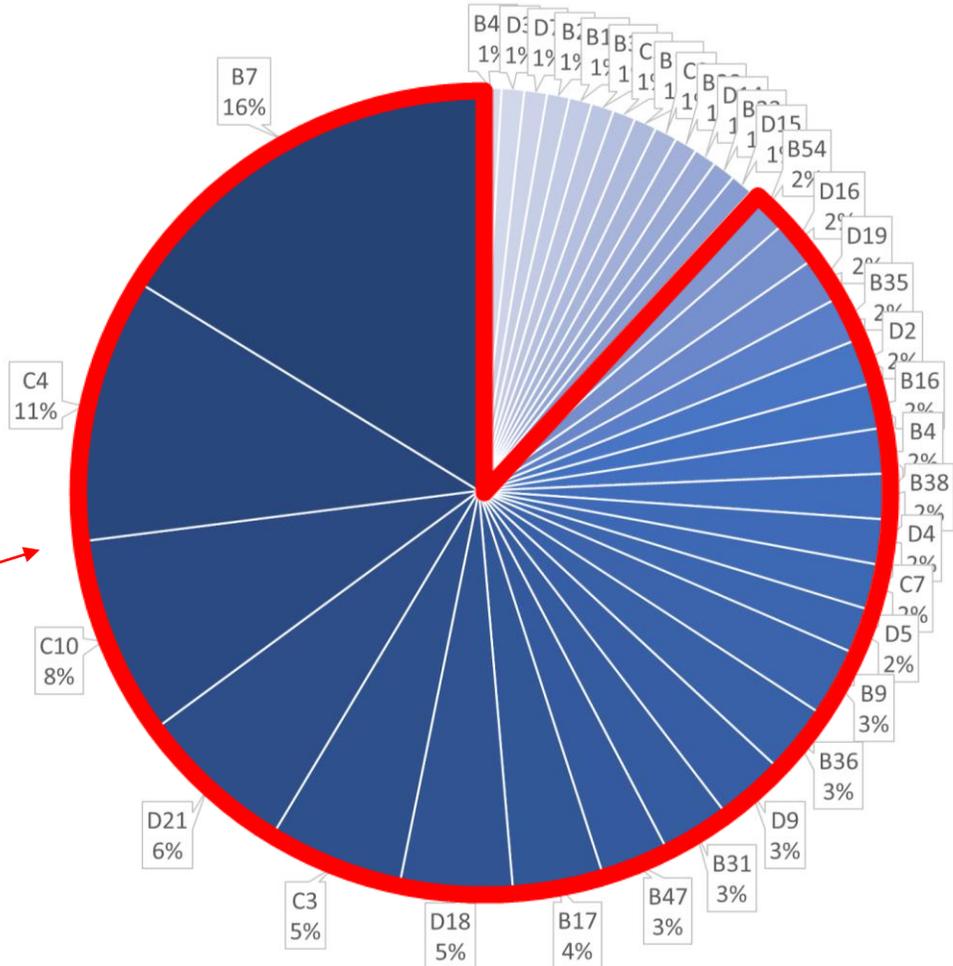

Use Case 2: Shipment Monitoring

An Opportunity to Improve

Analysis of Depot-to-Site

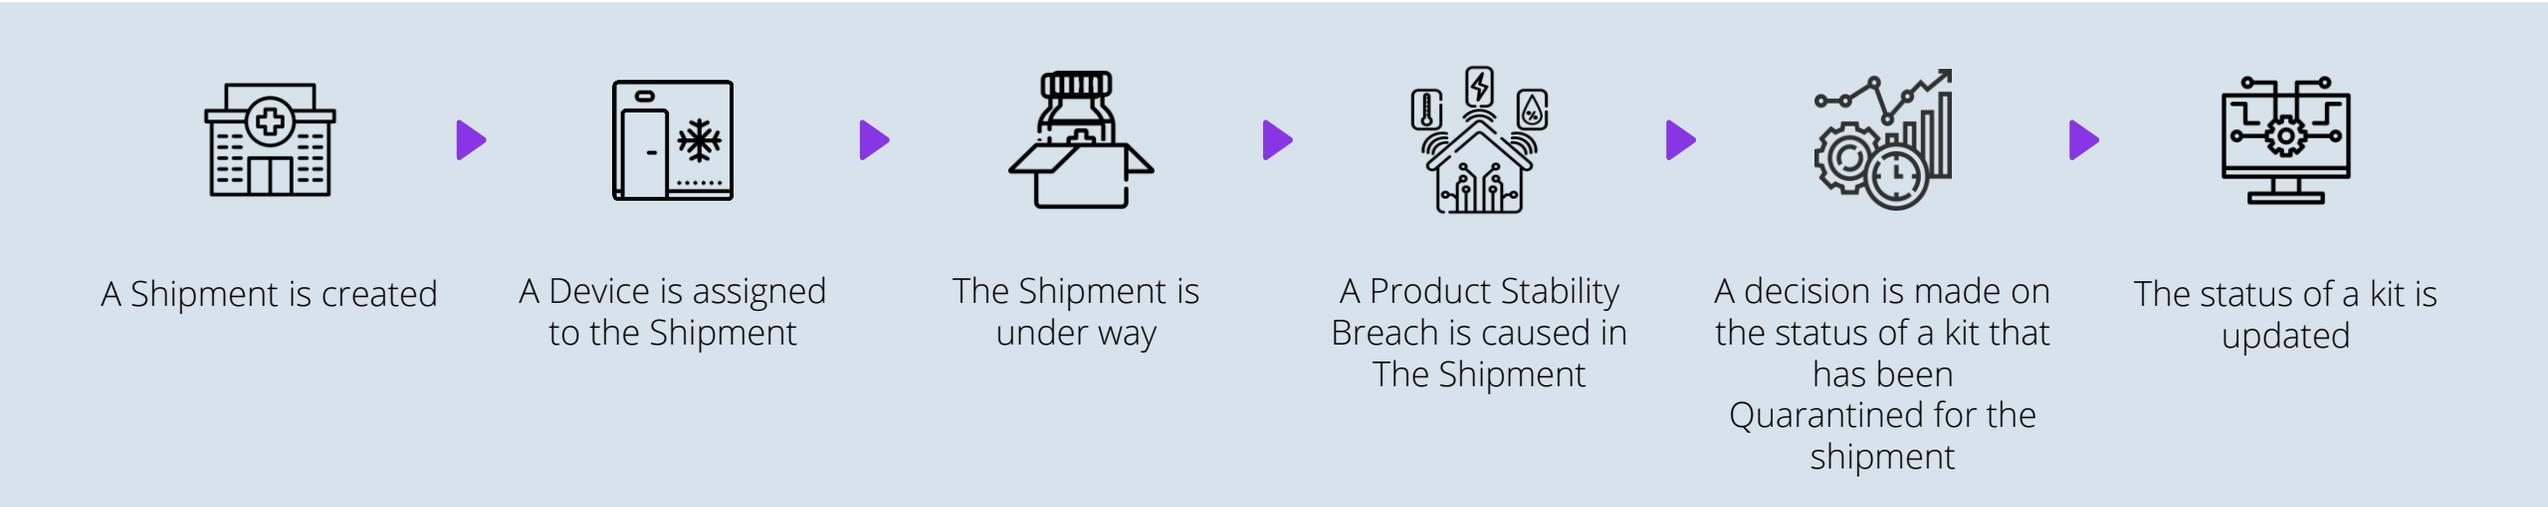

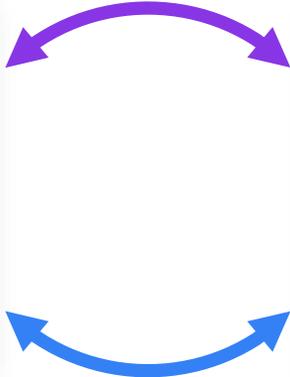

- Over 1800 shipments
- 79 shipments where 1 or more excursions occurred
- Most of the temperature excursions happened in legs B7 (16%) and C4 (11%) and have led to stability budget breaches
- Opportunity to further delve into “risky” legs and improve: lane assessment

These Depot-Site shipments have led to full stability budget breaches

▶ Streamlining Depot-to-Site Logistics for Efficiency and Accuracy

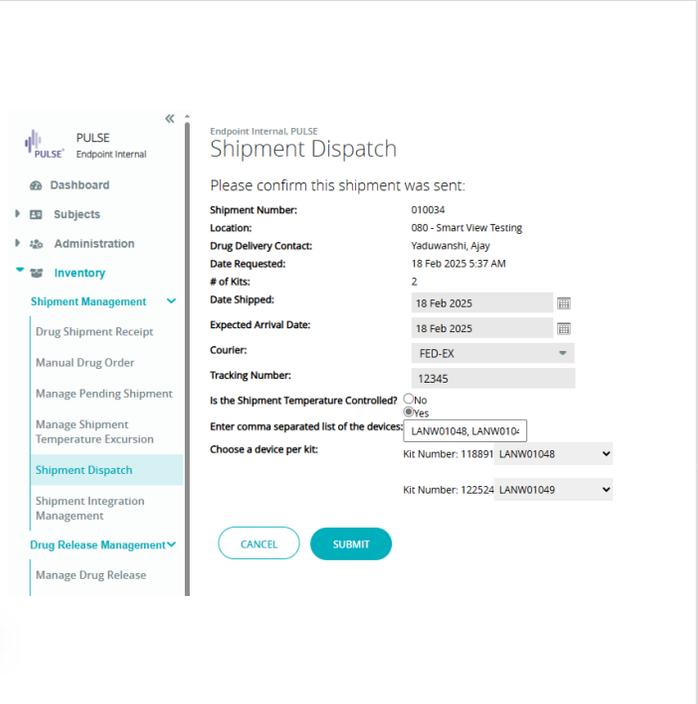

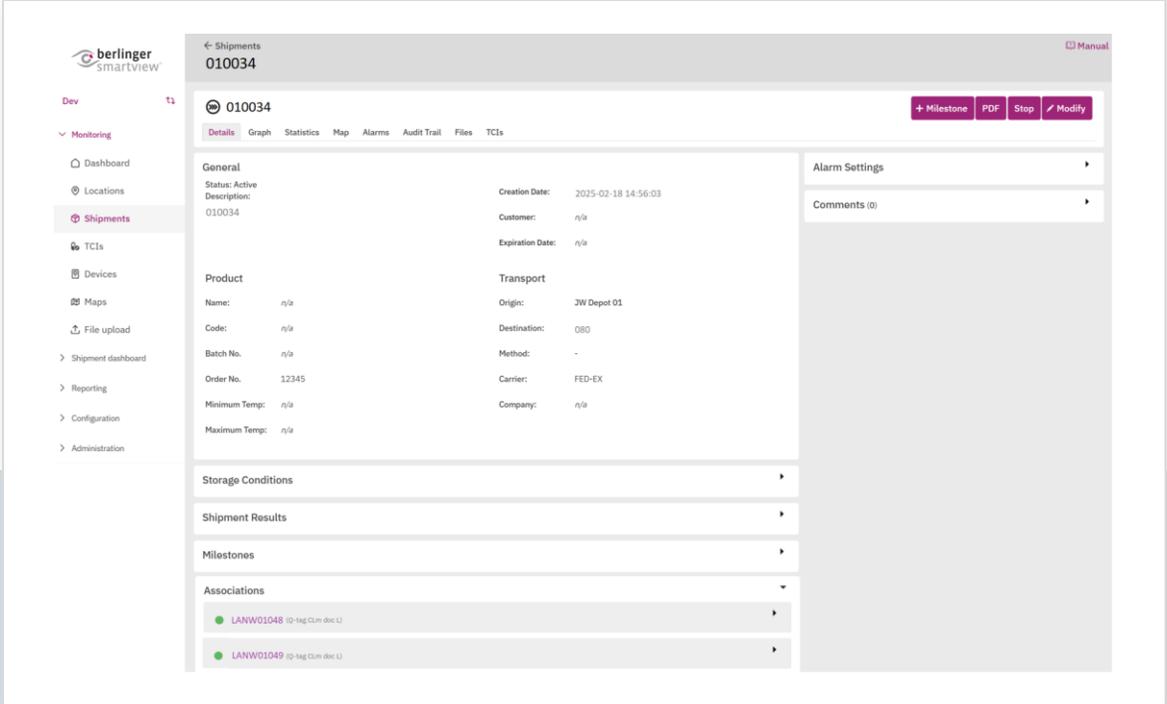

Real-Time Shipment Monitoring Automation

RTSM Shipment Creation

 Within IRT, Shipments are raised and dispatched. Each Kit is assigned a device which monitors the kit's status.

Product Stability Breach

✕ ALARM

More ▾

Once kits and shipment are within SmartView they are monitored via the device associated.

If the device records a discrepancy according the stability rule configured per drug type an **alert will be sent to IRT** to inform of a breach.

Breach Response in RTSM

If SmartView detects a Stability Budget Breach, i.e. the device reports the temperature is out of set range for a certain period of time an alert is sent to IRT.

IRT will determine which kits are associated to the triggered device, whether it is a shipment or a sector and will update each kit accordingly. This status is then sent back to SmartView keeping both systems aligned.

Clinical Trial Temperature Monitoring Process

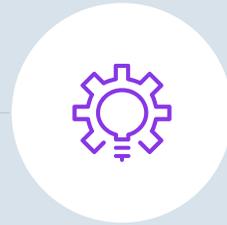

Conclusions

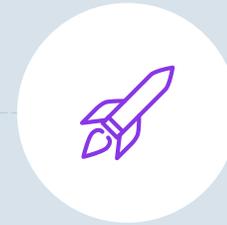

Seamless RTSM & SmartView integration **ensures clinical sites maintain continuous access** to temperature-sensitive treatments.

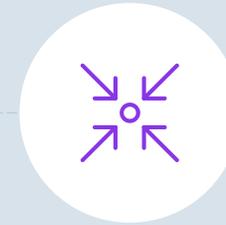

By automating monitoring, response, and resupply, RTSM **minimizes human error, enhances compliance, and reduces wastage.**

Sponsors benefit from **improved efficiency, reduced operational burdens, and strengthened trial integrity.**

The future of clinical supply management is in **real-time, data-driven decision-making**—empowered by RTSM and SmartView.

By reducing manual interventions, optimizing resupply, and preventing unnecessary drug wastage, RTSM delivers **significant cost savings** for sponsors and sites alike.

Thank you.
